

Water Restoration Act Could Lead to Privatization of Water and Affect Us All

June 19, 2008

Darrell Gerber and Myrna Paticha have contributed an article which outlines the danger of water privatization which could lead to our water being controlled by special interests to the detriment of all. The article was written by Barbara Minton and appeared in the Denver Post on April 15, 2008. It is as follows:

Water Restoration Act May Lead to Privatization of Water Supply

by Barbara L. Minton

(NaturalNews) The fate of the nation's water supply is under debate as hearings in the House and Senate begin on the Water Restoration Act of 2007. Opponents claim this Act threatens to greatly expand the Federal Government's roll in water management. This Act would define waters of the U.S. as "all interstate and intrastate waters and their tributaries, including lakes, rivers, streams (including intermittent streams) mudflats, sand flats, wetlands, sloughs, prairie potholes, wet meadows, playa lakes, natural ponds, and all impoundments of the foregoing". In other words, this bill will give the federal government total control of the most basic of all commodities necessary to life on this earth.

The Environmental Protection Agency and the Army Corps of Engineers currently have authority over all waters considered navigable in the U.S. The Code of Federal Regulations 33 CFR

329.4 defines navigable waters as “those waters that are subject to the ebb and flow of the tide and/or presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce.”

The Water Restoration Act, a bipartisan bill lead/sponsored by Congressman Oberstar, is an amendment to the Federal Water Pollution Act, commonly known as the Clean Water Act. Since major amendments were enacted in 1977, the Clean Water Act protected all of the nation’s waters as Congress intended, until 2003, when the Bush administration gave in to pressure from corporate polluters and redefined the meaning of [water](#). This happened through a bureaucratic device called a ‘guidance’, whereby the EPA instructed federal environmental law enforcers to back off from holding many polluters accountable.

Proponents of the Clean Water Restoration Act see it as restoring what was Congress’s original intent, that the Clean Water Act protect all of the nation’s waters. They see water quality and quantity issues as needing examination this spring, and believe now is the time for getting legislation to protect the [water supply](#) in order with the passage of this Act. They see the Act as offering needed protection from water pollution, from terrorists, and being in the interests of national security.

Is water a basic human right or a commodity?

Under the Public Trust doctrine, the government is prohibited from converting something such as water to the status of a commodity. Water is considered a basic human right that must remain in the public trust, meaning that it is so important to our survival that it should never be reclassified as a commodity. Many believe that the Water Restoration Act lays the

foundation for removing water from the Public Trust and facilitating it to fall under the ownership and control of corporations as a commodity. This is similar to how seeds have fallen into corporate control when they were once viewed as part of the Public Trust under the assumption that all people have a right to seeds with which to grow food for themselves.

Commodity owning corporations can now sue the government if it acts in any way to prevent them from making profits they believe they are entitled to. This ability to sue for impaired profit making can be the result of environmental regulations, of Federal laws which may prevent the corporations from hiring illegal workers, or issues of eminent domain in which an individual's land stands in the way of corporate earnings, and the courts have not acted to protect the interests of the corporation.

All the corporation has to do to supersede [federal](#) law is claim 'trade illegal' provisions of NAFTA and CAFTA. Federal laws and regulations are then put aside, along with property rights. CAFTA goes a long way in establishing the privatization of water supplies, including in-land navigated waters and the right to use and access the water supplies.

Federal control over all water may lead to its [privatization](#)

If the federal government is unable to gain total control of all water from whatever source, it is highly unlikely that water can be taken from the status of Public Trust and changed to that of commodity. If in fact the Water Restoration Act allows for the complete control of the federal government over all water in the country, as its opponents claim, water can lose its status as part of the Public Trust, and become a commodity available for corporate ownership.

The Water Restoration Act federalizes all inland and coastal

waters from any source. This Act is needed to set the stage for the corporate privatization guaranteed under CAFTA, and would effectively convert the entire water supply from any source into the status of a commodity.

As it stands now, any corporate agriculture business operating in any area is allowed to bypass water treatment plants, sewage treatment, and tap directly into underground aquifers even if it depletes the water supply to the surrounding communities. GMO seeds require up to three times the normal amount of water to activate and grow, but efforts to limit use or regulate disposal have been unsuccessful. The corporate rights are seen to exceed those of the individual and community as CAFTA clearly claims priority for "investor protections".

Opponents of the Water Restoration Act see the World Bank along with the United Nations as active in the effort to use NAFTA as well as CAFTA to convert the world's water supply to commodity status, to be controlled by private investors via global trade and investment agreements. Water will no longer be a community or individual right and resource if they are successful. Water will become a globally traded commodity subject to markets and the ability to pay, just like oil has.

If the World Trade organization is able to convert water to the status of a tradable commodity, it will be subject to international trade policies favoring only the giant corporation and investors. When corporations have sought to overturn domestic environmental laws or regulations, the laws have been declared null under the 'trade illegal' provisions of both NAFTA and CAFTA which declare that the right of the corporation cannot be superseded or infringed upon by laws or regulations that hinder the amount of profit they estimate can be attained.

Privatization may lead to abuse

Under a currently established World Bank system, credit or loans will not be issued to Third World countries and others unless they agree to allow foreign investors access to privatize their water supply. It required mass demonstrations in Bolivia to force out a subsidiary of Bechtel that had privatized the water supply, increased costs three-fold initially, dispensed with system upkeep, and left a quarter of the rural homes without access to water.

England privatized their water system, resulting in a 45% overnight increase in costs. Maintenance levels dropped and the quality of the water deteriorated significantly.

Several people became ill and one died from an E. coli contamination in a Canadian town after the water supply was privatized. The owner of the water knew of the contamination but did not notify the public until people became ill.

In a meeting at the Hague, water executives stated that as long as water was coming out of the tap, the public had no right to any information as to how it got there or its quality.

In the U.S. private investors have already succeeded in taking over some community water supplies. In other places the communities have fought against the sale of publicly held supplies realizing that this most important element of human survival should never be in the control of private corporations whose one and only duty is to produce ever increasing profits for investors.
